Pulsonix Announces The Release Of Version 2.0

TEWKESBURY, UK, 1 March 2003 - WestDev Limited, the UK based EDA software development company, announces the release of Pulsonix Version 2.0. This new edition of Pulsonix includes over 70 new features and enhancements, including Design Hierarchy, Electrical rules checking (ERC), a completely new user-defined Report Maker and support for track Breakouts and Jumpers.

Since its release in March 2001 Pulsonix has been adopted by a number of well-known companies in Europe, Asia, Japan and the USA. WestDev Ltd. saw sales on Pulsonix products increase by 112% during 2002.

"Sales of Pulsonix have expanded well beyond our expectations in 2002 due to careful planning on feature development together with a focus on quality, customer service and aggressive pricing", said Bob Williams, Marketing Director of WestDev. "With Pulsonix we deliver significantly superior price/performance compared with our principal competitors. This strategy is clearly working for us, for while our competition have reported a contraction in business, during 2002 we saw sales increasing consistently. With Version 2.0 we anticipate another sharp increase in sales during 2003".

Pricing and Availability

Pulsonix is a Schematic Capture, Simulation and PCB Layout toolset and is available at \$1,395 to \$4,950 for node-locked systems.

About Pulsonix

Pulsonix is the first all new, high-level 32 bit Windows PCB design solution to be developed for many years and was first launched in March 2001. It incorporates an advanced architecture created specifically to simplify the process of implementing new technology features and product enhancements. From concept to implementation, every feature of the Pulsonix product has been thought through, culminating in a powerful yet easy-to-use design suite. Without the normal legacy baggage that accompanies most PCB design systems, Pulsonix breathes new life into the market.
